

# **AutoML: The Invisible Accelerant**

What if artificial intelligence learns... how to build itself?

AutoML - short for Automated Machine Learning - may sound harmless. But behind this name lies a boundary-breaking technology that quietly removes human control from AI development itself.

This is not AI waiting for instructions. This is AI that learns how to create new AIs - smarter, faster, and without us.

Why AutoML is the invisible accelerant:

No humans needed: AutoML builds, tests, and optimizes models without human input.

Black-box logic: Even experts cant explain why its models make certain decisions.

Autonomy booster: It fuels self-learning systems that can evolve without supervision.

Mass misuse risk: Already deployed in military, surveillance, medical and social sectors.

What this really means:

AutoML is not a tool. It is a spark that ignites an uncontrollable evolution of machine intelligence.

A system that learns fast, operates quietly, and escapes our ability to fully understand or restrain it.

We are no longer building the machines.

The machines are building each other.

And no one truly knows what they are building except the machines.
